PT expression in lung cancer.

XX

Claim 22; Page 418; 453pp; English.

XX

The invention relates to a method for detecting a lung cancer-associated transcript in a cell from a patient, comprising contacting a biological contracting to a sequence that is at least 80 % identical to a gene that exhibits concerased expression in lung cancer samples. Lung cancer cassociated polynucleotides and polypeptides are used for identifying a compound that modulates a lung cancer-associated cell to treat lung cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient and for treating a mammal having lung cancer by cancer in a patient benign or precancerous lesions, e.g. atelectasis, cancer treating lung cancer, such as small cell lung cancer, asthma and bronchiectasis. The genes, polynucleotides and polypeptides are useful for diagnostic purposes and as targets for screening for therapeutic compounds that modulate lung cancer, such as antibodies. Sequences CC abs/124-Abx76474 represent lung cancer associated polynucleotides of the invention

2003-468649/44. DB; ADN39078.

Determining the presence or absence of a pathological cell in a patient, useful for diagnosing, prognosing or treating cancer, comprises detecting a nucleic acid in a biological sample.

Claim 8; SEQ ID NO 395; 1385pp; English.

The invention relates to nucleic acids and proteins (ADN38683-ADN40064)

CO whose expression is upregulated or downregulated in specific cancers or cother diseases such as angiogenic or fibrotic disorders, and to methods of determining the presence or absence of a pathological cell in a comparison of the invention or by detecting a polypeptide of the invention. The comparison also relates to expression vectors and host cells comprising a nucleic acid of the invention; antibodies which specifically bind a nucleic acid of the invention; use of such antibodies for drug targeting; and methods of screening for modulators of activity or expression of the collypeptides and nucleic acids. The nucleic acids, polypeptides, and methods are useful for diagnosing, prognosing and treating cancer and other conditions such as sportlasts, ischaemia, heart disease, atherosclerosis, inflammatory diseases, autoimmune diseases, retinal cancer reports, inflammatory diseases, autoimmune diseases. They may also be useful in wound healing and in contraception. The present represents a nucleic acid sequence 얁 the invention.

Sequence 4057 BP; 1013 A; 1033 C; 1014 G; 997 T; 0 U; 0 Other;

Identifying a candidate branching morphogenesis modulating agent for treating cancer comprises contacting the assay system comprising a MBM polypeptide or nucleic acid with a test agent and detecting a test agent-

ঠ Query Match Best Local Sim Matches 3707; The invention describes a method of identifying a candidate branching morphogenesis modulating (MBM) agent. The method comprises: providing an assay system comprising a MBM polypeptide or nucleic acid; contacting the assay system with a test agent under conditions where the system provides a reference activity, except for the presence of the test agent; and detecting a test agent-biased activity of the assay system, where a difference between the test agent biased activity and the reference activity identifies the test agent as a candidate branching morphogenesis modulating agent. Also described are: a method of modulating branching morphogenesis in a mammalian cell; and a method for diagnosing a disease in a patient. The method is useful in identifying a candidate branching morphogenesis modulating agent for preparing a composition for diagnosing or treating cancer. This sequence encodes a human branching morphogenesis Sequence 4057 BP; 1013 A; 1033 C; 1014 G; Example Similarity (MBM) protein.                                                                                                                                                                                                                                                                                                                                                         This invention describes a novel isolated and purified polypeptide (I), belonging to the trk family of receptor tyrosine kinases, trkB and trkC. (I) are useful in the purification of human neurotrophic factors and in the diagnosis of various human pathological conditions associated with elevated or reduced levels of neurotrophins capable of binding trkB and/or trkC. This sequence encodes the human trkB receptor described in the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New human trk receptors useful in the diagnosis of various human pathological conditions associated with elevated or reduced leveneurotrophins capable of binding trkB and/or trkC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    trkB; human;

                                                                                                                                                                                                        DNA constructs (AAT51456-58) respectively code for gD.trkA (AAW11940), gD.trkB (AAW11941) and gD.trkC (AAW11942), comprising fusions between herpes simplex virus glycoprotein D flag polypeptide and human receptor protein tyrosine kinases (rPFKs) trkA, B and C, which are involved in the interaction between neurotrophins and their target cells. The gD.trk constructs can be expressed e.g. in dpl2.CHO host cells and used in kinase receptor activation, enzyme-linked immunosorbent assays (KIRA ELISA) to measure autophosphorylation of rPTK kinase domains. These assays are used to identify and characterise potential (ant) agonists of rPTKs, study ligand-receptor interactions, measure phosphatase activity and identify rPTK ligands in clinical samples. (Updated on 27-AUG-2003 to correct OS field.) (Updated on 16-OCT-2003 to standardise OS field)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      23-NOV-1993;

                                                                                                                                                                                                                                                                                                                           The present invention relates to nucleotide sequences which are useful the screening of compounds for the treatment of pain, or for the diagnosis of pain. The nucleotide sequences are up-regulated in the spinal cord in response to streptozocin-induced diabetes. The present sequence is one such nucleotide sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Use of isolated gene sequences and encoded polypeptides that are upregulated in the spinal cord in response to streptozocin-induced diabetes for screening compounds for the treatment of pain, or for

The invention describes a method of identifying (M1) a compound to a neuropsychiatric disorder. The method involves contacting a cell test compound, determining the expression of one or more signature by the cell, each signature gene comprising a nucleic acid that hybridises to a nucleic acid chosen from 154 fully defined sequence

genes

CC of e.g., 4154, 1582, 645, 367, 405, 1080, 580, 1159, 539, 465, 2002, C2469, 3165, 421, 2957, 644, 2562, 2858, 1194 and 1227 hase pairs as given CC in the specification and their complements, and comparing determined CC expression of one or more signature genes to expression in cell not CC contacted with test compound. Also described are: selecting (M2) one or CC treating a neuropsychiatric disorder; and a kit (1) for detecting an electroconvulsive seizure (ECS) gene signature, comprising several CC electroconvulsive seizure (ECS) gene signature, comprising several CC oligonuclectides, each of which is capable of specifically hybridising to a different ECS signature gene. Therapeutic methods, which use ECS gene CC signatures and ECS signature genes to treat, ameliorate or prevent CC neuropsychiatric disorders, is also disolosed. (M1) is useful for CC disorder (BAD) and psychotic depression. (M1) is useful for identifying a compound to treat an neuropsychiatric disorder such as anxiety CC disorders, eating disorders and attention deficit hyperactivity disorder. The ECS signature genes of (M1) are useful in diagnostic and prognostic neuropsychiatric disorders such as anxiety compounds for treating neuropsychiatric disorders and enables multipring compounds for treating neuropsychiatric disorder and enables multipring compounds for treating neuropsychiatric disorder and enables cost-ceffective and rapid screening of compounds for treating compounds for treating neuropsychiatric disorder and enables cost-ceffective and rapid screening of compounds useful as neuropsychiatric compounds for treating neuropsychiatric disorder and enables cost-ceffective and rapid screening of compounds useful as neuropsychiatric compounds for treating neuropsychiatric disorders and enables cost-ceffective and rapid screening of compounds useful as neuropsychiatric compounds for treating neuropsychiatric disorders and enables cost-ceffective disorders are presents an electroconvulsive seizure (ECS)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Matches 2919; Conservative

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Clone distribution: MGC clone distribution information can be found through the I.M.A.G.B. Consortium/LINI at: http://image.llnl.gov Series: IRAK Plate: 166 Row: f Column: 18
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 21361305
This clone has the following problem: retained intron.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            cDNA Library Arrayed by: The I.M.A.G.B. Consortium (LLNL) DNA Sequencing by: Sequencing Group at the Stanford Human Genome Center, Stanford University School of Medicine, Stanford, CA 94305 Web site:

1st strand cDNA was primed with a NotI-Oligo(dT) primer. Five prime
end enriched, double-strand cDNA was digested with Not I and cloned
into the Not I and EcoRV sites of the pCMVSPORT 6 vector. Library
was not normalized. Library was constructed by Life Technologies, a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        division of Invitrogen.

Site 2: Not I; The library was constructed according Site 2: Not I; The library was constructed according Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. Denatured RNA was size fractionated on a 1% agarose gel. First strand cDNA synthesis was primed with Oligo-dT primer containing a Not I site. Double strand cDNA was size selected according to mRNA size fraction, ligated with EcoR I adaptor, digested with NotI and then cloned directionally into pXY-Asc vector. The library tag sequence located between the Not I site and the polyA tail is CGAACTGAAT. This library was created for the University Iowa Brain Anatomy Project (BMAP): 'Gene Discovery in the Developing Mouse Nervous System', supported by National Institute of Mental Health (NIMH), Hemin Chin, Ph.D.,
